Calibration and Measurement Capability (CMC) is expressed in terms of the measurement parameter, measurement range, expanded uncertainty of measurement and reference standard, method, and/or equipment. The expanded uncertainty of measurement is expressed as the standard uncertainty of the measurement multiplied by a coverage factor of 2 ( $k=2$ ), corresponding to a confidence level of approximately 95%.

Notes:

1. On-site calibration service is available for this parameter, since on-site conditions are typically more variable than those in the laboratory, larger measurement uncertainties are expected on-site than what is reported on the accredited scope.
2.  $D$  = diameter in mm,  $DL$  = diagonal length in inches,  $fL$  = foot lambert,  $inD$  = diagonal inches,  $l$  = length in mm,  $L$  = length in inches, mil = 1/1000 of an inch or 0.001 inch,  $T$  = applied torque.
3. Test currents up to 1000 A are generated using 50 turn coil with no loss of accuracy.
4. This scope is formatted as part of a single document including Certificate of Accreditation No. L2222
